Advancing Sustainable Aquaculture in the Emirate of Abu Dhabi

Hamad Almansoori – Unit Head, Aquaculture

18 April 2024

EAD's Role

Ensure that aquaculture is conducted by means that have a benign, if not positive, net impact on the environment.

Ensure that the aquaculture sector maintains high standards of environmental stewardship by utilizing environmentallysustainable technologies and practices.

Monitor the effects of aquaculture operations on the surrounding environment and use the results to support best management and continuous improvement.

Our task includes the development of effective and enabling policies, regulations and codes of conduct, enforcement and penalty systems, and streamlining of the permitting process.

Sustainable Aquaculture Policy

SUSTAINABLE AQUACULTURE POLICY

Abu Dhabi Emirate March 2019

فينه البينة الولايين

ACTION 01

Implementation of the integrated interagency new permitting system for aquaculture.

ACTION 3

Encourage economic investment in the sector by developing a fund, subject to application, criteria and discretion, to kick start aquaculture development.

Encourage research and innovation in the field of aquaculture through the development of an aquaculture research plan.

ACTION 6

Develop marketing and communication's material to facilitate investment in the sector, including by fishermen.

ACTION 2

Development of an Aquaculture Policy Implementation Strategy identifying suitable aquaculture models, species and sites for the designation as aquaculture development zones, and the development of management and investment plans for these zones.

ACTION 4

 (\star)

Establishing a specific Aquaculture Decree that streamlines and clarifies existing legislation, sustainability criteria, regulations and institutional framework.

Establishment of Sustainable Aquaculture Development Zones at Al Dhafra Region of Abu Dhabi Emirate

 As part of implementing the sustainable aquaculture policy initiatives, supporting and developing the sector in the emirate, EAD conducted a hydrodynamic modelling study to allocate suitable aquaculture zones in the vicinity of Delma island and Al Sila.

Modelling Objectives

Determine the capacity of fish that can be cultured in marine cages sustainably in the selected areas.

Analyze the potential environmental impacts of aquaculture activities on the marine environment.

|--|

Determine how long the environment will take to recover to its normal form after cages are removed.

Environment Agency – Abu Dhabi

Integrated Hydrodynamic Modelling Tool

Hydrodynamic Predicts movement of water into and out of the system

Fish waste Predicts the volume of waste for a given volume of fish

Particle transport Tracks the vertical and horizontal movement of wastes

Waves

Gives realistic estimates of wave height, period and direction

Water quality Simulates water quality pathways

সা

Biogeochemical Predicts flux of nutrients, metals, DO and others

Pilot Scale Aquaculture Sea Cages Project – Delma Island

• Commence project operation to culture local important overexploited fish species in marine cages.

Pilot Scale Aquaculture Sea Cages Project – Delma Island

Pilot Scale Aquaculture Sea Cages Project – Delma Island

Artificial Intelligence based monitoring and data collection system.

The system will include

Environmental sensors - Water quality

Underwater & outdoor Cameras

- Fish behavior
- Feeding process
- AQ infrastructure

Benefits

- Early detection of potential diseases
- Production plan simulations
- - Utilize Solar panels
 - 24/7 real time fish weight estimation
 - Estimate fish weight (95%)
 - Feed optimization
